SUMMARY

Software engineer with 5+ years building and running production web platforms for manufacturing, payroll and finance, healthcare, and SaaS. Full stack in TypeScript, React, Node.js, and Python on AWS and GCP. I led frontend architecture at Syntax, where 10 manufacturing plants run their production lines on the platform: 4 major releases with zero rollbacks and planning time cut by about half. Before that, I built an in-house ERP for 1,400 employees across 5 companies and led its team of 5. I start from how people actually work, then design the system, the release process, and the standards that let a small team ship safely.

EXPERIENCE

Syntax

Apr 2025 – Sep 2026

Frontend Lead · Full-time

Remote

- Led frontend architecture for a production-planning platform that 10 manufacturing plants use to run equipment and production lines, including a real-time 3D view of the factory floor.
- Shipped 4 major releases with zero rollbacks by gating every release on code review, automated checks, and post-deployment validation agreed with the operations team.
- Cut production planning time by about 50% by turning manual scheduling steps into data calculations and recommendation views planners act on directly.
- Kept data-heavy planning screens loading in under 100 ms as the plant data and the 3D view grew.
- Set the frontend architecture and engineering standards adopted by 6 engineers, cutting review cycles by 30%.
- Built a 25+ component design system with accessibility built in, cutting feature delivery time by 40%.

Marham Care

Nov 2024 – Mar 2025

Software Engineer · Part-time

Remote

- Built and ran a healthcare content platform with about 2,000 monthly visitors.
- Introduced Jest and SuperTest test suites and a Jenkins / Bitbucket CI/CD pipeline with test gates, so no release reaches production without passing automated checks.
- Brought incident resolution down to about one hour through monitoring, structured logging, and root-cause analysis.

G-Gateway

Jun 2024 – Oct 2024

Full Stack Developer · Contract

Remote

- Architected event-driven job-matching services in Node.js and Python on GCP Pub/Sub and Cloud Run, with containerized deployments.
- Ran 15+ Prisma schema migrations in production through controlled rollouts that protected existing data and kept the service up.
- Traced integration failures end to end across APIs, databases, and message queues, and fixed root causes instead of symptoms.

Eddekhar

Mar 2023 – May 2024

Full Stack Mobile Engineer · Full-time

Remote · team in Saudi Arabia

- Built an in-house ERP covering payroll, finance, and treasury for 1,400 employees across 5 companies, and led a team of 5 engineers that delivered it.
- Cut report turnaround from one week to one day by modelling organizational, payroll, and finance data in Neo4j behind REST APIs, with query optimization, caching, and pagination.
- Ran production database migrations with zero downtime using staged rollouts, pre-migration backups and rollback plans.
- Secured payment and API workflows with authentication, authorization, input validation, and secrets management.
- Owned production operations on AWS and GCP: IAM and access control, TLS certificates, DNS, scheduled jobs, automated backups and restore validation.

AI-Baab

Sep 2022 – Feb 2023

Full Stack Engineer · While completing B.Sc.

Remote · team in Saudi Arabia

- Cut deployment cycles by 50% while maintaining 99.9% uptime by introducing CI/CD and code review.
- Designed Neo4j data models and Cypher queries for enterprise workflows serving thousands of concurrent users.
- Coached junior engineers on scoping MVPs, writing testable code, and explaining trade-offs.

Easy-Sales AI

Feb 2021 – Aug 2022

Software Engineer · While completing B.Sc.

Remote · team in Canada

- Grew sales by \$300K (200%) in two months: user research showed active users weren't buying because of pricing, timing, and purchase intent, so we rebuilt the purchase journey, trial, and onboarding.
- Built the React UI and Python APIs that served real-time sales-opportunity predictions from AWS Lambda and SageMaker on a platform with about 6,000 monthly visitors.
- Simplified onboarding so new customers went live the same day, and automated infrastructure setup with Python and Bash.

SELECTED PROJECTS

- **TRENDOW**, restaurant operating system for the MENA market: point of sale, kitchen display, stock and cash drawer in one product, in Arabic and English. Tech lead for a team of 3. Next.js, TypeScript, Zustand. In progress.
- **Requirements classifier**, classifies software requirements (90.7% functional vs. non-functional with SVM, 74% across 11 non-functional types), flags ambiguous wording and drafts a BRD. Python, scikit-learn.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, SQL, PHP, Bash

Frontend: React, Next.js, Angular, Redux, Zustand, RxJS, Tailwind CSS, design systems, WCAG, Core Web Vitals

Backend: Node.js, Express, NestJS, FastAPI, REST, GraphQL, WebSockets, event-driven architecture, microservices

Data: PostgreSQL, MySQL, MongoDB, Neo4j / Cypher, Redis, Firestore, Prisma

Cloud & delivery: AWS (Lambda, SageMaker, S3, CloudFront, API Gateway, DynamoDB), GCP (Pub/Sub, Cloud Run, Cloud Storage), Docker, Nginx, Jenkins, GitHub Actions, GitLab CI, Bitbucket Pipelines

Quality & ops: Jest, SuperTest, code review, release gates, monitoring and logging, root-cause analysis

Machine learning: PyTorch, Hugging Face, scikit-learn, model serving on AWS SageMaker

EDUCATION & RESEARCH

B.Sc. Computer Systems Engineering, AI-Azhar University

Sep 2018 – Jun 2023

Co-author, [Brain Tumor Classification using Deep Learning. IEEE iCareTech](#), Aug 2020. 300+ citations.
